HOCL spray for COVID 19 and other viruses

What is HOCL spray and how to use it?

HOCl is an antimicrobial agent that kills viruses, bacteria, fungi, and spores. It promotes health and stimulates epithelial growth for wound healing and skin issues, as well as reduces inflammation.

COVID – 19 virus is known to spread through the breath, the mucous membranes (including the eyes) and other yet unknown routes.

Keep your face protected by using HOCl spray frequently, throughout the day, in the face and mouth, your hands and any other exposed surface areas. It is also safe to spray into your eyes.

Use a diffuser filled with HOCl at home to evaporate HOCl at least 15 minutes per room every couple of days. (Use a separate diffuser than you use for essential oils, so you do not inactivate the HOCl.) You can nebulize HOCl as well.

If you have to leave your home, spray your door handle, steering wheel, keys, phone, face and hands as you enter your car and exit your car.

While at home it is suggested using HOCl to spray down your countertops and tables. (Unlike traditional disinfectants you may be using, it is safe to ingest and won't expose you to unwanted chemicals.)

Where can I buy HOCL?

HOCL can be bought from <https://kiscience.com/product/hocl/> (please copy and paste this link into the browser)
